

Lecture 2 - Tables / Insert / Select

Feb 20, 2020

SQL databases are composed of a set of tables.

A table is a set of columns, with names and types - like a struct or record in other languages.

There is a set of rows - that act kind of like an un-ordered array of columns.

SQL normally stores this as a row-order store.

Some SQL-ish databases like Cassandra store this as a colum-store.

```
$ psql
pg=# \i create-tables.sql
pg=# \q
$
```

the file

```
1: -- \c l02
2: create table vote_by_county (
3:     id                serial primary key,
4:     year              int default 2021,
5:     state             text default '--',      -- irritatingly all upper case.
6:     state_uc          text default '--',
7:     state_po          varchar(2) default '--', -- Incorrectly Named Column!
8:     county_name       text default '--',      -- irritatingly all upper case.
9:     county_name_uc    text default '--',
10:    county_fips        int default 0,
11:    office             text default 'unk',
12:    candidate          text default 'unk',
13:    candidate_uc       text default 'unk',
14:    party              text default 'unk',
15:    candidatevotes     int default 0,
16:    totalvotes         int default 0,
17:    version            int,
18:    vote_mode          text
19: );
```

Output

```
CREATE TABLE
```

Let's just insert a few rows to see how insert works:

```

1: -- \c l02
2:
3: insert into vote_by_county ( year, state, county_name, version ) values
4:   ( 2022, 'Wyoming', 'Albeny', 1 );
5: insert into vote_by_county ( year, state, county_name, version ) values
6:   ( 2022, 'Wyoming', 'Big Horn', 2 );
7: insert into vote_by_county ( year, state, county_name, version ) values
8:   ( 2022, 'Wyoming', 'Carbon', 8 );

```

Output

```

INSERT 0 1
INSERT 0 1
INSERT 0 1

```

Now we can get the data back:

```

select year, state, county_name, version
      from vote_by_county ;

```

Data Types for tables

The data types used in our example:

| Type | Description |
|----------------------|---|
| serial | an integer that is generated (if null) by the database. |
| int | an integer (bigint, numeric etc) |
| text | a string from NULL, 0 length to 2**33 bytes in length. |
| varchar(maxlen) | A 'text' field with a limited length. |
| char(maxlen) | a right blank-padded fixed length string. |
| char varying(maxlen) | same as varchar() |

not null disallow NULL values.

default Value if insert skips this value then default will be used. This is different than the value NULL.

primary key means that .

There are a bunch of other data types in PostgreSQL (MySQL/MariaDB has a bunch too, Oracle has a bunch, MS Sql Server too).

| Name | Aliases | Description |
|-----------|---------|-------------------------------------|
| bigint | int8 | signed eight-byte integer |
| bigserial | serial8 | autoincrementing eight-byte integer |

| Name | Aliases | Description |
|---|---------------------------------|--|
| <code>bit [(n)]</code> | | fixed-length bit string |
| <code>bit varying [(n)]</code> | <code>varbit [(n)]</code> | variable-length bit string |
| <code>boolean</code> | <code>bool</code> | logical Boolean (true/false) |
| <code>box</code> | | rectangular box on a plane |
| <code>bytea</code> | | binary data ("byte array") |
| <code>character [(n)]</code> | <code>char [(n)]</code> | fixed-length character string |
| <code>character varying [(n)]</code> | <code>varchar [(n)]</code> | variable-length character string |
| <code>cidr</code> | | IPv4 or IPv6 network address |
| <code>circle</code> | | circle on a plane |
| <code>date</code> | | calendar date (year, month, day) |
| <code>double precision</code> | <code>float8</code> | double precision floating-point number (8 bytes) |
| <code>inet</code> | | IPv4 or IPv6 host address |
| <code>integer</code> | <code>int, int4</code> | signed four-byte integer |
| <code>interval [fields] [(p)]</code> | | time span |
| <code>json</code> | | textual JSON data |
| <code>jsonb</code> | | binary JSON data, decomposed |
| <code>line</code> | | infinite line on a plane |
| <code>lseg</code> | | line segment on a plane |
| <code>macaddr</code> | | MAC (Media Access Control) address |
| <code>money</code> | | currency amount |
| <code>numeric [(p, s)]</code> | <code>decimal [(p, s)]</code> | exact numeric of selectable precision |
| <code>path</code> | | geometric path on a plane |
| <code>pg_lsn</code> | | PostgreSQL Log Sequence Number |
| <code>point</code> | | geometric point on a plane |
| <code>polygon</code> | | closed geometric path on a plane |
| <code>real</code> | <code>float4</code> | single precision floating-point number (4 bytes) |
| <code>smallint</code> | <code>int2</code> | signed two-byte integer |
| <code>smallserial</code> | <code>serial2</code> | autoincrementing two-byte integer |
| <code>serial</code> | <code>serial4</code> | autoincrementing four-byte integer |
| <code>text</code> | | variable-length character string |
| <code>time [(p)] [without time zone]</code> | | time of day (no time zone) |
| <code>time [(p)] with time zone</code> | <code>timetz</code> | time of day, including time zone |

| Name | Aliases | Description |
|--|---------------------------|------------------------------------|
| <code>timestamp [(p)] [without time zone]</code> | | date and time (no time zone) |
| <code>timestamp [(p)] with time zone</code> | <code>timestampztz</code> | date and time, including time zone |
| <code>tsquery</code> | | text search query |
| <code>tsvector</code> | | text search document |
| <code>txid_snapshot</code> | | user-level transaction ID snapshot |
| <code>uuid</code> | | universally unique identifier |
| <code>xml</code> | | XML data |
